

## Jotne interests in R&D

edf2025@jotne.com

### About Jotne

Jotne is a Norwegian SME software company, highly specialized in the Aeronautics, Space and Defense domain, providing interoperability solutions within Digital Twin, MBE, Simulation, PLM, IoT and more to manage all system data in engineering and operational phases. All software developed by Jotne is based on Open Standards like ISO TC184/SC4 and more specifically ISO 10303 for CAD/FEM/PLM/IoT and the foundation for AI/ML.

Jotne provides support to the most complex defence programs like F-35 and Eurofighter for the last 25 years and have running programs with the stakeholders like Lockheed Martin, Airbus, Leonardo and BAE Systems and European Space Agency (ESA).

Jotne started with EU R&D and EDA programs in 1991 and have currently several EU programs. In addition, we run 3 EDF projects, dTHOR, EDINAF, and SDMMS. We have strong relationships to academia and recently completed a PhD related to the Digital Twin topic.

OSLO, Norway, Dec. 10, 2024 /PRNewswire/ -- Jotne, a leader in digital engineering solutions, proudly announces the expansion of its long-standing collaboration with Lockheed Martin to accelerate digital transformation across the Aeronautics, Space, and Defense sectors. This \$1,900,000 contract is part of a multi-year program that integrates Jotne's advanced software solutions to streamline data exchange, reduce costly rework, and speed up aircraft development cycles.

Jotne's collaboration with Lockheed Martin Aeronautics focuses on enhancing a trusted, open-standards-based digital repository that supports product lifecycle data interoperability. By adopting Jotne's innovative technologies, Lockheed Martin aims to reduce the complexities and costs associated with managing Technical Data Packages (TDP), making product development more efficient and cost-effective.

### Driving Innovation with ISO 10303-STEP Standards

At the heart of this partnership is the implementation of the ISO 10303-STEP standard, which enables seamless data exchange across different engineering, manufacturing, and supply chain management systems. This international standard ensures that data can be

# With the wish to create new knowledge

All started with an idea back in 1991 and resulted in an EU project “PRODEX” which ran from July 1992 through June 1995. Then the NATO NETMA and the Eurofighter GmbH team started to talk with us and still using our software in 2024, after 25+ years.

R&D projects has proven to be a good vehicle for joint efforts and to create new business opportunities.

# Interoperability for Digital Twin, PLM, Simulation and Technical Data Packages, utilizing open standards

Jotne is a leading provider of advanced engineering software solutions for the Aerospace, Defence, and Space industries. The company's applications offer a comprehensive suite of tools for managing the entire product lifecycle, from concept design to product retirement and it help organizations optimize their product development processes and increase efficiency.

Examples of leading organizations that trust the ISO 10303 (STEP) standards and the Jotne applications to support it

# LM Digital Twin Maturity Model

Simulation /  
Virtual Prototypes

## Level 1 – Virtual Digital Twins (DT)

### Virtual Digital Twins – Prototype Modeling and Simulation

Do you have high fidelity or physics based digital twin models and simulations for :

- Configuration and Master Data
- Stealth
- Structural Performance
- MBSE Requirements and system interferences
- Vehicle Systems, Flt Controls, and SW
- Mission Systems and SW
- Operations Analysis
- Manufacturing/Production
- Supply Chain
- Sustainment, Reliability, Maintainability, Safety
- Affordability/Cost/Capital Req.

Does your Digital Twin predict mission success and compliance with customer requirements?

Did your models identify opportunities?

## Level 2 – DT/PA Synchronization

### Manual Virtual/Physical Synchronization of Digital Twins

- Is your DT representative of the physical asset?
- Did your DT baseline facilitate design trades and configuration optimization?
- Are your DT models manually updated for design and requirement changes?
- Does your digital twin represent the physical asset performance and design?
- Are your DTs manually updated with the latest test and field data?
- How well did your level 1 DT support the physical asset performance and configuration baseline?
- Were major changes required after design start to address performance or requirements issues unidentified by the DT?
- Are your DTs resident in an integrated design environment?
- Do your DT simulations interact with hardware in the loop?
- Did your virtual PAVs identify opportunities for improvements?

## Level 3 – DT/PA Validation

### Automated or Continuous Virtual/Physical Synchronization and Validation of Digital Twins with Physical Assets

- Are your DT models routinely or automatically synchronized to the latest configuration baseline?
- Do your DTs predict physical asset behavior?
- Are your DT models automatically updated to represent the latest test, field, or analysis data?
- Have your DTs predicted problems with the physical asset performance, design, field results, or requirements that require corrective action?
- Has validation or qualification or fielded results of the physical asset identified unexpected problems?
- Do your DTs support visualization capabilities in the simulation environments?

## Level 4 – DT/PA Integration

### Enterprise Integrated Product Digital Twin

- Do your DT simulations drive your hardware in the loop?
- Does your DT enable parts monitoring, forecasting and predictions from operational data?
- Do you have mature integrated DT models to support Operations Analysis, spiral development, and sustainment?
- Are your physical asset validations used to improve your DT development and sustainment tools in preparation for the next product development cycle?
- Does the DT accurately predict performance in the operational environment?
- Have your DTs eliminated some or most legacy physical testing and lab validation?
- Is the DT accredited as the Master Model of the Product that can be used for virtual customer validation of requirements?

21<sup>st</sup> Cen - JADO

## Level 5 – DT Operational Ecosystem

### Digital Twins Common Operational Simulation Ecosystem

- Can your DT models be connected and integrated with other LM product DTs and with customer provided non LM assets in a common simulation environment?
- Do your DTs adequately predict actual performance and operations (including sustainment data) in the JADO environment?
- Will customers use simulation based performance and operations validation without requiring subsequent physical demonstrations?
- Is your DT development and testing used to upgrade your DT tools and processes?
- Do customers utilize Integrated Digital twin effects as certification criteria?
- Did your models identify opportunities for improved performance in the simulation environment?
- Do your interoperable DT's predict the performance of coordinated mission effects across multiple domains (land, air, sea, space, cyber)?

DT/PA = Digital Twin/Physical Asset

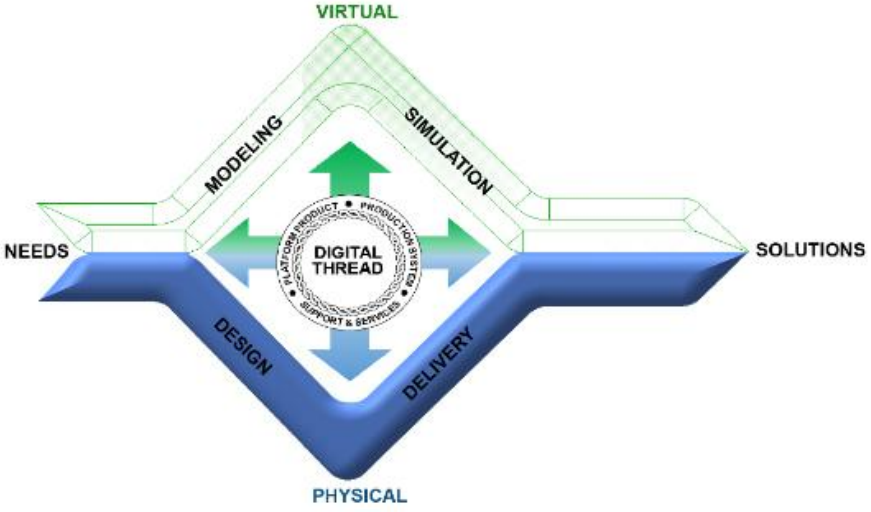

# Standards

This Lockheed Martin, MBE Playbook will have major impact on current and future projects, both in the supply chain, partnerships, and customers. Jotne as a supplier of ISO 10303-STEP software applications stand behind such strategy and is ready to support, promote and sustain these capabilities.

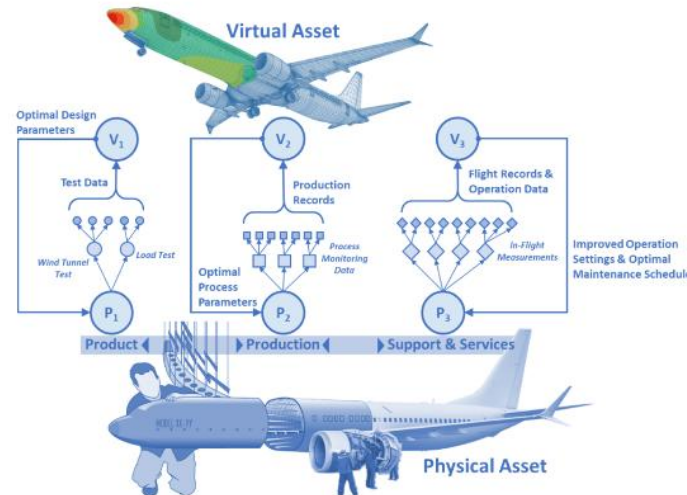

Evolution of System Engineering (SE) to Model Based Engineering (MBE)

The digital thread is a linked set of artifacts whose consistency is actively managed over the life cycle of the product. The digital thread is an engineered digital system. As the design matures over time, the relationships of these models become the foundation for design re-use, cycle time reduction, and improved quality.

Both companies identify ISO 10303-AP 242 (STEP)

# DT and its adoption by OEMS

# DT and its adoption by Aerospace OEMs

## Standards

1. Need to develop appropriate standards and/or standard approaches so that Digital Twins can interact with other **Digital Twins across the life cycle and supply chain.**
2. Significant value and increased collaboration could be realized by establishing appropriate foundational **open standards (e.g. data and models)** and life cycle architecture frameworks.
3. Therefore, additional focus and effort should also be given to addressing which **elements of this foundation should be open.**

# Jotne in European research and technology programs

DIGITAL TWIN  
CONFERENCE

25 JUNE  
08:30-13:00

**SPEAKER'S  
KNOWLEDGE**

DEFENCE

SPACE

MANUFACTURING

AI AND IOT

At Oslo Military Society  
Myntgaten 3, Oslo, Norway

**PRESENTATIONS  
AND INSIGHTS**

**LEARN FROM THE EXPERTS**

Supported by experts from Lockheed Martin, Airbus, and team members contributing at European Space Agency (ESA), European Defense Funds (EDF), and EU Horizon Europe programs.

**FOCUS AREAS**

Digital transformation (DX) of engineering data consists of capabilities related to Digital Twin, Digital Thread and application areas like PLM, TDP, Simulation, and IoT connectivity for AI. All using Open Standards for improved data exchange, sharing and archiving.

**WHO SHOULD ATTEND**

CIO, CxO IT Architects, CAD and CAE users, PLM/ERP managers, AI/ML developers and project managers in the ASD field.

Register now - [www.event.jotne.com](http://www.event.jotne.com)  
[helpdesk@jotne.com](mailto:helpdesk@jotne.com)

dTHOR will consolidate end-users military operational requirements based on improved battle damage and structural integrity assessment, reduced hydro-acoustic signatures, and more accurate operation of weapon systems
